

25 January 2022

MEMORANDUM For \_\_\_\_\_

SUBJECT: Service Member Statement Regarding Counseling

1. On XX Month 2021, I was provided a counseling statement (page 13, etc.) wherein I elected to provide a statement.

2. I signed the statement, not in agreement with the counseling, but simply because I was told it was required.

3. This counseling, attached, included the following statements:

a. The COVID-19 vaccines are safe and effective. Contrary to this statement, a review of the current VAERS (vaccine adverse event reporting system) information reveals the following as of 10 September 2021: almost 15,000 deaths, almost 6,000 instances of anaphylaxis, over 1800 miscarriages, over 6,000 heart attacks, almost 6,000 instances of Myocarditis/Pericarditis, almost 20,000 permanently disabled, over 60,000 hospitalizations, and much more.

b. You are ordered to receive a vaccine with full licensure approval. The Assist. Sec. of Defense in a memo dated, 14 September 2021, stated that Comirnaty and BioNTech are “interchangeable,” which is not true. It is impossible to characterize BioNTech as being interchangeable with the Comirnaty approved drug until such time as the phase III clinical studies being conducted at this moment under the current IND/EUA regulations are completed. These tests are not scheduled for completion until 2025, at which time the contents of the drug may be re-tested to verify if the ingredients are the same, substantially the same or different. As such, at no time should the DOD or any other agency presume that BioNTech is an approved drug; it is not and this is why it continues to carry the characterization of an Investigational New Drug for Emergency Use only.<sup>1</sup>

c. Vaccination has proven to be the most effective defense against COVID-19. COVID-19 has a 99.7% or greater survival rate among those under 60 and without underlying health issues. Young men and women of the military are at almost zero risk of a serious reaction or death from contracting the COVID-19 virus. Many have already had the virus and now have natural immunity. Why would someone who already had the virus and has natural immunity be at risk for the virus again? Even if this person contracted the virus again, they have already had it and apparently were not impacted at all.
